Mai Ndombe Forest

Democratic Republic of Congo

Reducing emissions, protecting biodiversity and empowering communities in Central Africa

In the heart of the Congo, a place marked by poverty and environmental challenges, a project rises. Previous logging areas near Lake Mai-Ndombe have transformed into a conservation haven spanning 248,956 hectares. The project curbs deforestation through community-driven efforts, sustainable agriculture, education, health improvements, and biodiversity monitoring. Together with the community, the project protects not just the land, but the future.
