

Mapetex System

**ANTI-FRACTURE SYSTEM FOR LAYING CERAMIC
TILES AND STONE MATERIAL**

Mapetex System

System for installing ceramic and stone with MAPETEX, the special anti-fracture membrane made from synthetic non-woven fabric which, when used in combination with highly deformable MAPEI adhesives (class S2), allows the following:

- 1)** To install flooring on cracked cementitious substrates or on substrates that are not perfectly cured to prevent cracks in the substrate damaging the finished floor; the non-woven fabric in the system stops the cracks spreading to the new floor covering.
- 2)** To install flooring on cementitious screeds without respecting the position of existing non-structural movement joints.

When installing removable ceramic flooring, **Mapetex System** is suitable to protect substrates (chipboard, parquet, PVC, linoleum, ceramic, etc.) and to help remove and replace tiling quickly.

Advantages of Mapetex System

Safe

- Prevents cracks propagating from the substrate to new ceramic tiles or stone flooring
- Slim, compact system that has very little effect on the overall thickness

Rapid

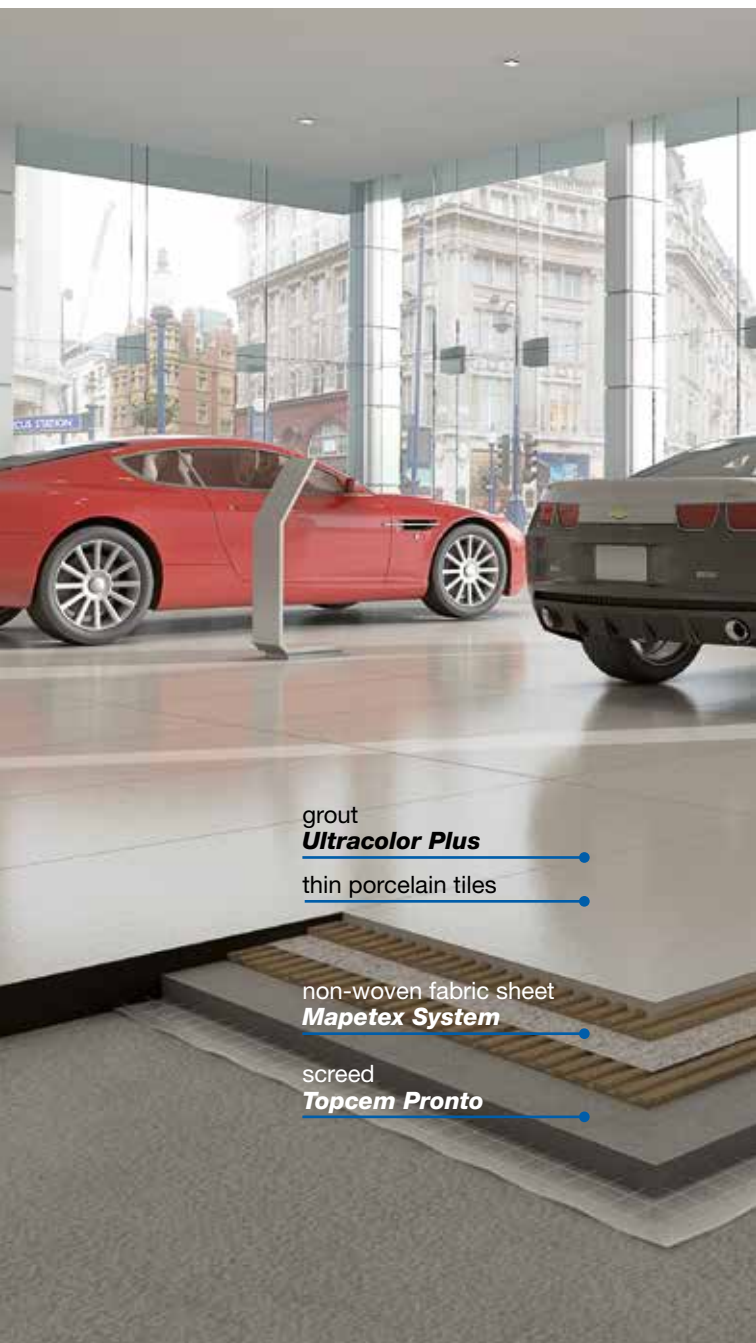

- Ceramic and stone can be installed on substrates that are not completely cured
- May be installed without tracing the pattern of existing distribution joints
- Rapid-setting adhesives may be used so flooring can be put into service more quickly (such as **Ultralite S2 Quick**, **Elastorapid**, **Keraquick S1 + Latex Plus**)

Easy

- Easy to install
- Simple and quick removal
- Clean working conditions
